

X-PLUS

Versatility & Reach

| www.vielight.com
| info@vielight.com

The X-Plus is a versatile rechargeable device. It can direct near infrared light to almost any location on the head or the body. The LED module emits continuous 810 nm near infrared (NIR) light. Photobiomodulation (PBM) of the brain, the thymus gland and of the gut are some of the options with the X-Plus. The LED rests on two expandable and flexible steel bands. This simple design allows to accommodate the X-Plus to fit different adult head sizes and body placements.

The nasal applicator, which comes with X-Plus, has a 633 nm wavelength red light LED. This light stimulates the circulatory system through the dense capillary network in the nasal passage.

A more holistic effect is attainable when the X-Plus is combined with the Vielight Neuro headsets. The X-Plus will deliver NIR to the back of the head, particularly the cerebellum, the area which the Neuro headsets do not cover. Together, the X-Plus and the Neuro headsets, complemented by their respective nasal applicators, can now deliver NIR light to most of the brain.

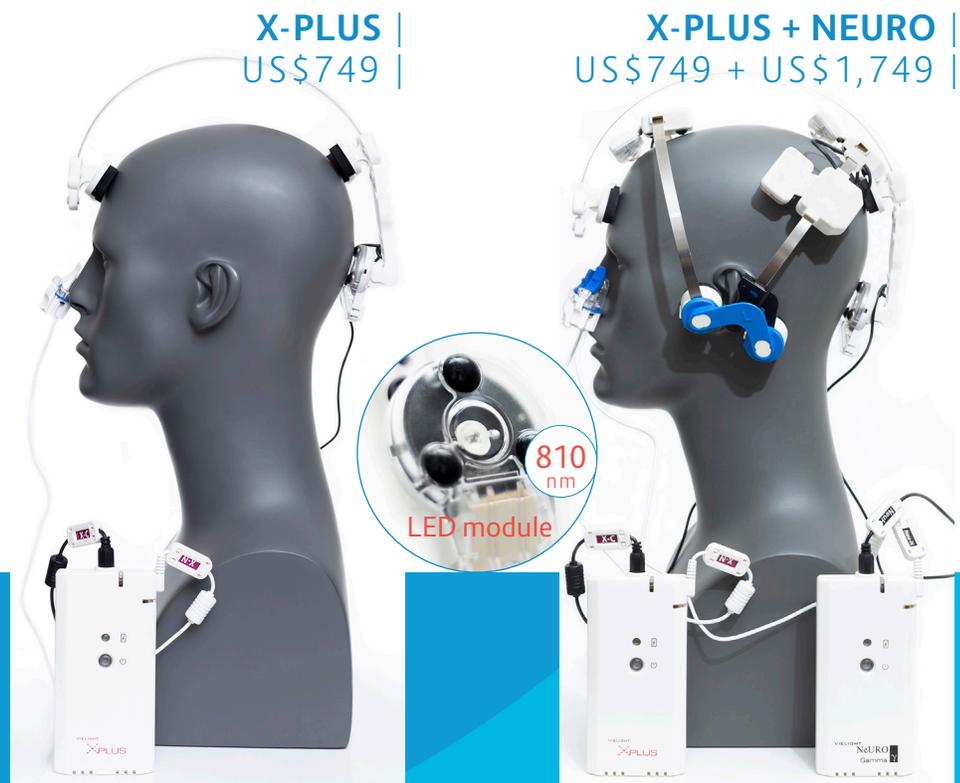

Recommended Usage: Use on its own generally once every two days or in combination with Vielight Neuro Alpha or Gamma devices.

Convenient Features: Each session is preset to last approximately 20 minutes and the device switches off automatically.

Multipurpose rechargeable PBM device. A fully-charged controller is sufficient for approximately twenty applications.

The X-Plus is a dual voltage device 110V and 220V (Only North American plug is included. Outside of North America, an appropriate travel adapter can be used.)

PBM Specifications: The nasal applicator emits 633 nm (wavelength) visible red light. The main LED module emits 810 nm (wavelength) near infrared (NIR) light.
